

Heated Build Tray

The build tray is designed to replace the standard build surface of a Fab@Home Model 3. It has a Kapton covering and a heating system that allows it to reach 300 degrees Fahrenheit (150 Celsius). The system uses an external temperature controller unit that runs on 120 VAC. When the Unit is received, the instructions for auto-tuning the system should be followed. Please see the instructions for the temperature controller which is included in the packaging for guidance on auto-tuning.
